Sommaire

- [1 How to call it](#)
- [2 Display](#)
- [3 How to use it](#)
- [4 How it is stored](#)

How to call it

For using the [GPGeodeticPoint](#) class, the developer has only to create such an object with these two possibilities:

- With an altitude coordinate:

```
geodWithAlt = new GPGeodeticPoint ("With altitude:");
```

- ... or without altitude coordinate (only name/latitude/longitude):

```
geodWithoutAlt = new GPGeodeticPoint ("Without altitude:", false, true);
```

- ... or without name (only latitude/longitude/altitude):

```
geodWithoutName = new GPGeodeticPoint ("Without name:", true, false);
```

We also may initialize the widget with predefined values:

```
GeodeticPoint geodeticPoint =
    new GeodeticPoint(FastMath.toRadians(45.),
                      FastMath.toRadians(10.), 120.e+3);
geodWithoutAlt = new GPGeodeticPoint("Without altitude:",
    geodeticPoint, false);
```

Note: we may initialize a widget with no display altitude even with a (complete) geodetic point.

Display

For both cases, the display will be:

With altitude:
Name: <input type="text"/>
Latitude: <input type="text"/> 0.0 deg
Longitude: <input type="text"/> 0.0 deg
Altitude: <input type="text"/> 0.0 km
Without altitude:
Name: <input type="text"/>
Latitude: <input type="text"/> 0.0 deg
Longitude: <input type="text"/> 0.0 deg
Without name:
Latitude: <input type="text"/> 0.0 deg
Longitude: <input type="text"/> 0.0 deg
Altitude: <input type="text"/> 0.0 km

How to use it

To get a [[PATRIUS \(CommonsMath\)](#)] `Vector3D` object, we will just have to call for the `getPatriusObject()` method as below:

```
GeodeticPoint point = geodWithAlt.getPatriusObject();
```

Note: even if the widget is initialized without altitude, this one will be stored in the GeodeticPoint (with a zero value).

How it is stored

Here is the [XML](#) format:

```
<GeodeticPoint name="With_altitude">
  <Real name="latitude" unit="deg">4.5E1</Real>
  <Real name="longitude" unit="deg">1.0E1</Real>
  <Real name="altitude" unit="km">1.2E2</Real>
</GeodeticPoint>
<GeodeticPoint name="Without_altitude">
  <Real name="latitude" unit="deg">1.1E1</Real>
  <Real name="longitude" unit="deg">2.2E1</Real>
  <Real name="altitude" unit="km">0.0E0</Real>
</GeodeticPoint>
```

Note: same remark as above when the widget is initialized without altitude.
